## CS 346: Meeting Minutes

Date: Oct 27<sup>th</sup>

Team: 211

Present: All

Absent:

---

### Agenda

- Discussing about the issues with setting up SQLite.
- Discussing about the feature of displaying events in both monthly calendar and daily calendar.

### Notes

- Setting up SQLite requires importing multiple packages and modifying of build. Gradle file also including Expose, which is a bit overwhelming to do
- Some type of Kotlin doesn't exist in SQLite and might require type conversion when I'm trying to store the data.
- When displaying events in the daily calendar, need to make sure if the event is more than one hour, then it displays correctly in the daily calendar.

### Decisions

- We decide to address the issue with setting up SQLite by consulting the documentation of SQLite along with Kotlin.
- We decide to show events at a specific hour if the hour is in the range of the event.

## **Actions**

- Setting up SQLite as soon as possible so that other features can use the database.
- Implementing the displaying events feature as soon as possible.
